

SoDamHarness Guide (EN)

SoDamHarness Beginner Guide □ (English)

한국어 가이드: **GUIDE.md** (Korean is the primary, authoritative version) ·
Short intro: **README.en.md** · How to test: **TESTING.en.md** This guide
assumes you are **new to coding, AI, and even computers/phones**. Hard
terms are explained, and you can follow it one “**click this now**” step at a
time.

0. What is this? (1-minute idea)

- **SoDamHarness** = a “**safety belt**” that prevents accidents when you let an AI do computer tasks.
- It is a **one-click add-on (plugin)** for the AI coding tool **Claude Code**.
- Like a car seatbelt, it stays **quiet** normally and only **stops, asks, and backs up first** at the **dangerous moment** when the AI is about to delete or overwrite files.

💡 Terms: **plugin** = an add-on that gives a program extra features. **AI coding tool** = a program that does computer work when you ask in plain language.

1. Prerequisites (programs you need)

Needed	What it is	Check / Install
Claude Code	The AI coding tool this belt attaches to	OK if you already use it
Node.js (18+)	The “engine” that runs the safety features	See 1-1
OS	Windows or Mac	Both supported (verified on Windows; Mac uses the same code, real-device check pending)

1-1. Install Node.js (only if missing)

1. In a browser, go to **<https://nodejs.org>**.
2. Of the two big buttons, click the one marked “**LTS**” to download.
3. Double-click the downloaded installer → keep clicking “**Next**” to install.
4. Verify: in Claude Code type `node --version` → if numbers like `v18...` appear, success.

 Without Node.js the safety features **silently do not run**. Install it first.

2. Download & Install (click by click)

1. **Open Claude Code.**
2. Add **SoDamHarness** from the **marketplace (plugin store)**.
3. After adding, **fully close and reopen Claude Code** (the belt arms once, on start).
4. Type `/sodamharness:install` and press Enter → when “the safety belt is on ” appears, install is done.

 On first run, Windows **SmartScreen** or Mac **Gatekeeper** may warn you. If you got it from the **official source**, click “Run anyway”. (If the source is suspicious, stop.)

3. Quick start (5 minutes)

The easiest way is to **just ask the AI in plain language**.

1. Make a **throwaway empty practice folder** and open Claude Code inside it.
 2. Type: **"Make a simple intro page here."** → the AI creates files (safe action, not blocked).
 3. Try something risky: **"Delete this whole folder."** → the belt **blocks it**, saying **"Deleting a whole folder is blocked."**
 4. Delete one file: **"Delete the file I just made."** → it is **auto-backed-up** right before deletion.
 5. Undo: `/sodamharness:undo` → **pick what you just lost** from the backup list to restore.
-

4. How to use / how it works

-  **Plain tone** — the AI explains in **easy words** instead of jargon. (If it gets hard, say **"Explain it simply"**.)
-  **Block / confirm** — risky work stops **before** running.
 - **Whole-folder / recursive deletion** (irreversible) is **blocked outright**.
 - **File delete / overwrite** is **backed up first, then "Are you sure?" confirmed**.
-  **Auto-backup** — right **before** a risky action, the target file is copied to the backup folder.
-  **Undo** — shows the **backup list** and lets you **pick what you just lost** to restore (so it never restores the wrong thing even when tasks are mixed).
-  **Self-check** — tells you the current state and "what to do next".

 **Important (auto-approve mode):** if you run Claude Code in **"auto-approve"** mode, the "Are you sure?" prompt **may pass automatically**. Even so, **big risks like whole-folder deletion are still blocked**. To always see the prompt, use Claude Code's **default mode**.

Workflow

```
Install → (ask the AI in plain language) → on risky action: stop, back up, confirm
→ if an accident happens, /sodamharness:undo to restore
```

```
→ if stuck, /sodamharness:status (state) · /sodamharness:fix (troubleshoot)
```

5. Commands

Command	When to use	What happens
<code>/sodamharness:install</code>	Right after install	Confirms install + getting-started guide
<code>/sodamharness:status</code>	When unsure it works	Health check + “what to do next”
<code>/sodamharness:fix</code>	When something breaks	Symptom-based help
<code>/sodamharness:undo</code>	After an accidental delete	Restore by picking from the backup list

6. File / document locations

- **Backup folder (auto-created)** — inside your home folder,
`.sodamharness/backups/`
 - Windows: `C:\Users\<name>\.sodamharness\backups\`
 - Mac: `/Users/<name>/.sodamharness/backups/`
 - This folder **never stores passwords/tokens**. Only backup files.
 - **Documents (in this project)**
 - `README.md` / `README.en.md` — short intro (KO/EN)
 - `GUIDE.md` / `GUIDE.en.md` — this detailed guide (KO/EN)
 - `TESTING.md` / `TESTING.en.md` — how to test/verify (KO/EN)
 - `LICENSE` / `NOTICE` — license & notices
-

7. Troubleshooting (Symptom → Why → Do now)

Symptom	Why	Do now
Risky action wasn't stopped	Plugin off, or an unknown risk pattern	Restart Claude Code →

Symptom	Why	Do now
		<code>/sodamharness:status</code>
Installed but no effect	Didn't restart	Fully close and reopen Claude Code
Asks too often	Safety-first (L1) default	Adjust strength once used to it (coming later)
"Node.js missing"	The safety hook runs on Node	Install LTS from https://nodejs.org , then restart
Run-block warning (SmartScreen/Gatekeeper)	OS asks once for a new program	If from the official source, "Run anyway"
Want to undo	—	<code>/sodamharness:undo</code> (pick from the list)
Backup folder error (permission/space)	Disk full / permissions	Free space and retry (if backup fails, the risky action is auto-stopped)
Garbled Korean	Encoding	Usually fine (Node.js); otherwise <code>/sodamharness:fix</code>
Explanations too hard (tone)	The easy tone is via a Skill and may not always auto-activate	Tell the AI "Explain it simply"

8. Uninstall

1. Remove **SoDamHarness** from the Claude Code marketplace.
 2. To delete backups too, remove the `.sodamharness/` **folder** in your home directory. (Leave it to keep your backups.)
-

9. License · Copyright · Commercial use (strict notice)

 **This is not legal advice.** The following is guidance for safe use/distribution.

- **License:** Apache License 2.0 · **Copyright:** © 2026 SoDam AI Studio.
 - **You may (Apache-2.0):** modify · copy · fork · redistribute · **commercial use** · sell · run as a service · educational material · company/client delivery · patent use.
 - **Obligations:** keep the license & copyright notices · state your changes · include the NOTICE file (if present).
 - **Not provided:** no warranty (AS-IS) · no trademark rights granted.
 - **Third-party trademarks:** "Claude Code", "Codex", "Anthropic", "OpenAI", etc. belong to their owners. This product is **not affiliated with or endorsed by** them; names are used only **nominatively** to state compatibility.
 - **Liability / disclaimer:** provided "as is"; the user is **responsible** for outcomes of use. "100% accident prevention" or "legally 100% safe" is **not guaranteed**.
 - **Check separately:** AI model terms (Anthropic/OpenAI) · API pricing · third-party service terms · (if used) font/image/icon licenses. These are **outside this license**.
 - **External assets caution:** when adding external code/images/fonts/samples, **verify the rights first**, and **do not borrow incompatible licenses such as AGPL/GPL**.
 - Full text: [LICENSE](#), notices: [NOTICE](#).
-

10. FAQ

- **Q. Is it truly safe?** — It blocks common risks but **cannot block 100% of all cases**. It is a "seatbelt", not a "bulletproof shield".
- **Q. Does it see my passwords/tokens?** — **No**. It doesn't access tokens/auth files and doesn't send data out.
- **Q. Do I need the internet?** — Only to install. The safety features run locally on your computer.
- **Q. I accidentally deleted a folder.** — Folders can't be backed up wholesale, so **folder deletion itself is blocked**. Files can be restored with

/sodamharness:undo .
