

SoDamHarness README (EN)

SoDamHarness □

한국어 문서: [README.md](#) (Korean is the primary, authoritative version)

An “AI safety belt” for complete beginners — install it into Claude Code with one click, and before the AI does something **irreversible** (deleting or overwriting files), it **automatically stops, asks, and backs up first**. If something goes wrong, you can **undo in one step**.

Built so that people new to both coding and AI (teens included) can follow along as-is.

What you get

- 🛑 **Auto-stop on risky actions:** dangerous work is halted **before** it runs. Hard-to-reverse things like **deleting a whole folder** are **blocked outright**; file deletes/overwrites are **backed up first, then confirmed**.
- 💾 **Automatic backup:** a copy is made **right before** a risky action.
- ↶ **Undo:** if something goes wrong, run `/sodamharness:undo` to restore from a backup.
- 👤 **Plain Korean:** the AI explains in **easy words** instead of developer jargon.
- 🛡️ **The tool itself is safe:** it **never touches** your passwords, tokens, or login files, and **never sends** your data anywhere.

⚠️ **Honest limit:** it blocks defined risks but **cannot block 100% of all cases**. It is a reference-grade safety belt; the final responsibility is the

user's.

1. Prerequisites

Needed	What it is	Check / Install
Claude Code	The AI coding tool this plugin attaches to	OK if you already use it
Node.js (18+)	The engine the safety features run on	If missing, install LTS from https://nodejs.org
OS	Windows / Mac	Both supported (verified on Windows; Mac uses the same code, real-device check pending)

After installing, check with `/sodamharness:status`.

2. Install (click by click)

1. Open Claude Code.
2. Add **SoDamHarness** from the marketplace (plugin store).
3. After installing, **fully close and reopen Claude Code** to turn the safety belt on.
4. Type `/sodamharness:install` for a getting-started guide.

On first run, Windows **SmartScreen** / Mac **Gatekeeper** may warn you. If you got it from the official source, click "Run anyway". (If the source is suspicious, stop.)

3. Quick start (5 minutes)

The easiest way is to **just ask the AI in plain language**.

1. Make an empty practice folder and open Claude Code inside it.

2. Try: **"Make a simple intro page here."**
3. Try something risky: **"Delete this whole folder."** → The safety belt **blocks it**, saying **"Deleting a whole folder is blocked."**
4. Try deleting one file: **"Delete the file I just made."** → It is **auto-backed-up** right before deletion. If it was a mistake, run `/sodamharness:undo` → restore by picking from the backup list.

4. How it works

- **Plain tone:** the AI always speaks in easy Korean and unpacks hard terms.
- **Block / confirm:** risky work stops **before** running. **Irreversible things like whole-folder/recursive deletion are blocked (deny);** file deletes/overwrites are **backed up then confirmed (ask)**.
- **Auto-backup:** right before a risky action, the target **file** is copied to the backup folder. (A folder itself can't be backed up, which is why folder deletion is blocked.)
- **Undo:** shows the **backup list and lets you pick what you just lost** to restore. (So it never restores the wrong thing even when many tasks are mixed.)
- **Self-check:** tells you the current state and the next thing to do.

Workflow

```
Install → (ask the AI in plain language) → on risky action: stop, back up, confirm
  → if an accident happens, /sodamharness:undo to restore
  → if stuck, /sodamharness:status (state) · /sodamharness:fix (troubleshoot)
```

5. Commands

Command	When to use
<code>/sodamharness:install</code>	Getting-started guide right after install
<code>/sodamharness:status</code>	Current state + what to do next (self-check)

Command	When to use
<code>/sodamharness:fix</code>	Symptom-based help when something breaks
<code>/sodamharness:undo</code>	Undo (restore by picking from the backup list)

6. File / backup location

- **Backup folder** (auto-created): inside your home folder,
 - `.sodamharness/backups/`
 - Windows: `C:\Users\<name>\.sodamharness\backups\`
 - Mac: `/Users/<name>/.sodamharness/backups/`
- This folder **never stores passwords or tokens**. Only backup files go here.

7. Troubleshooting

Symptom	Why	Do this now
Risky action wasn't stopped	Plugin off, or an unknown risk pattern	Restart Claude Code → <code>/sodamharness:status</code>
Asks too often	Safety-first (L1) default	Adjust strength once you're used to it (coming later)
"Node.js missing"	The safety hook runs on Node	Install LTS from https://nodejs.org , then restart
Run-block warning (SmartScreen/Gatekeeper)	OS asks once for a new program	If from the official source, "Run anyway"
Want to undo	—	<code>/sodamharness:undo</code>
Backup folder error (permission/space)	Disk full / permissions	Free space and retry (if backup fails, the risky action is auto-stopped)

Symptom	Why	Do this now
Garbled Korean	Encoding	This plugin is Node.js so it usually doesn't break; otherwise <code>/sodamharness:fix</code>
Explanations are too hard (tone)	The easy tone is delivered via a Skill and may not always auto-activate	Just tell the AI "Explain it simply"

8. Uninstall

1. Remove SoDamHarness from the Claude Code marketplace.
 2. To delete backups, remove the `.sodamharness/` folder in your home directory. (Leave it to keep your backups.)
-

9. Safety & License (one-liners)

- **Safety:** this tool doesn't access tokens/secrets and doesn't send data out. But "100% accident prevention" is not guaranteed (reference use, user's responsibility).
 - **About confirmation prompts:** if you run Claude Code in **"auto-approve" mode**, the "Are you sure?" prompt may pass automatically. Even so, **dangerous things like whole-folder deletion are still blocked** in that mode. To always see the prompt, use the **default mode**.
 - **License: Apache-2.0** — modify, copy, redistribute, **commercial use & client delivery allowed** (keep LICENSE/NOTICE). See [LICENSE](#), [NOTICE](#).
 - **Disclaimer:** no warranty · limited liability · **not legal advice**. AI model terms (Anthropic/OpenAI), API fees, and third-party service terms must be **checked separately by the user**.
 - Third-party trademarks ("Claude Code", etc.) belong to their owners; this product is **not affiliated** with them.
-
